

JRE and JVM:

Stack and Heap:

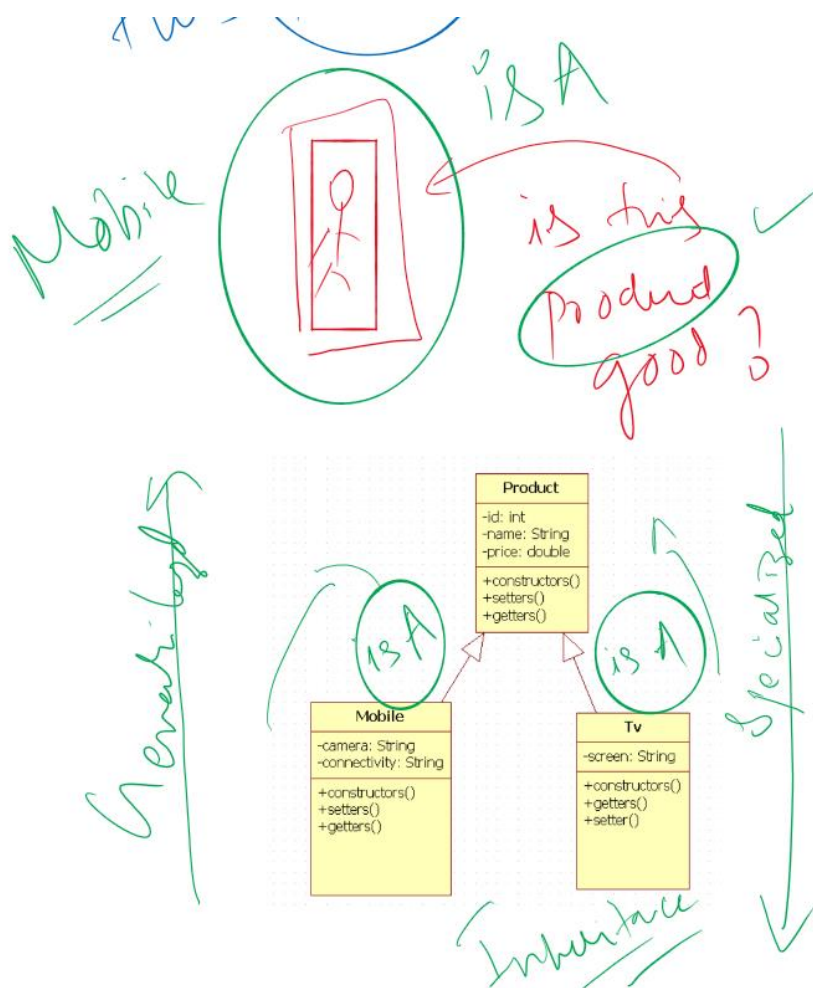

Static Variables shared by all objects of a class:

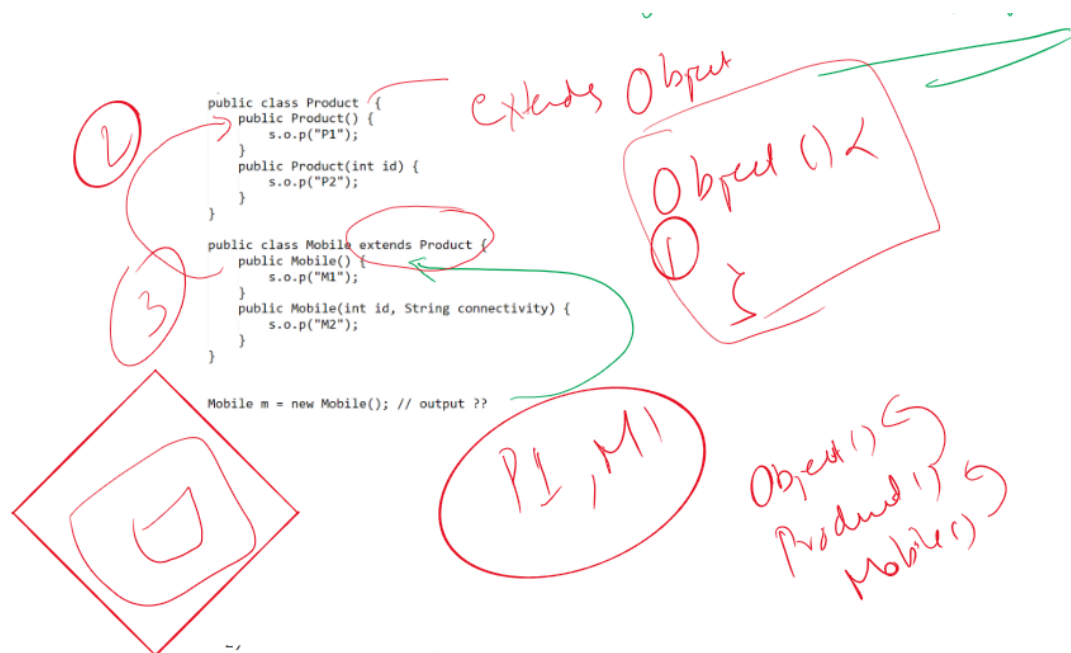

static int count ;

Generalization and Specialization Relationship [ IS A ]

## Constructor Chaining:

```

~
public class Product {
    public Product() {
        s.o.p("P1");
    }
    public Product(int id) {
        s.o.p("P2");
    }
}

public class Mobile extends Product {
    public Mobile() {
        s.o.p("M1");
    }
    public Mobile(int id, String connectivity) {
        s.o.p("M2");
    }
}

Mobile m = new Mobile(100, "iPhone XR"); // P1, M2
    
```

Annotations:

- A red arrow points from the `Product` class to the `Mobile` class.
- A red arrow points from the `Mobile` class to the `Mobile(100, "iPhone XR")` instantiation.

```

public class Product {
    public Product() {
        s.o.p("P1");
    }
    public Product(int id) {
        s.o.p("P2");
    }
}

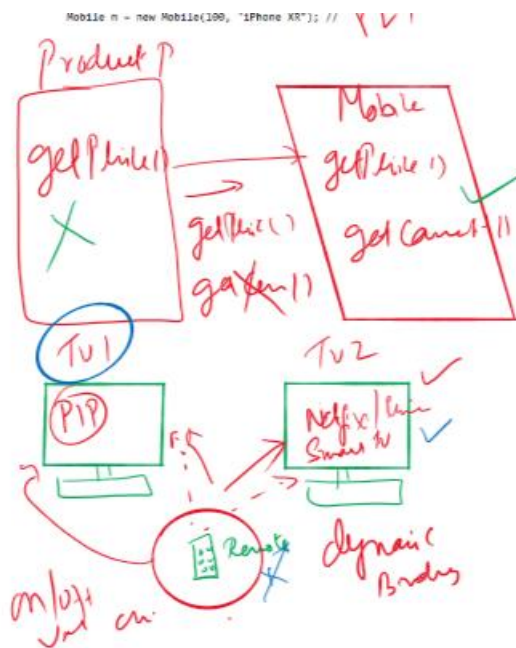

public class Mobile extends Product {
    public Mobile() {
        s.o.p("M1");
    }
    public Mobile(int id, String connectivity) {
        super(id);
        s.o.p("M2");
    }
}

Mobile m = new Mobile(100, "iPhone XR"); // P2, M2
    
```

Annotations:

- Handwritten "super()" with an arrow pointing to the `super(id)` call in the `Mobile` constructor.
- Handwritten "super()" with an arrow pointing to the `super(id)` call in the `Mobile` constructor.
- Handwritten "P2, M2" with an arrow pointing to the `Mobile` class.

Upcasting:

Arrays:

int[] elems = new int[4];

int[] data = {45, 122, 6, 15};

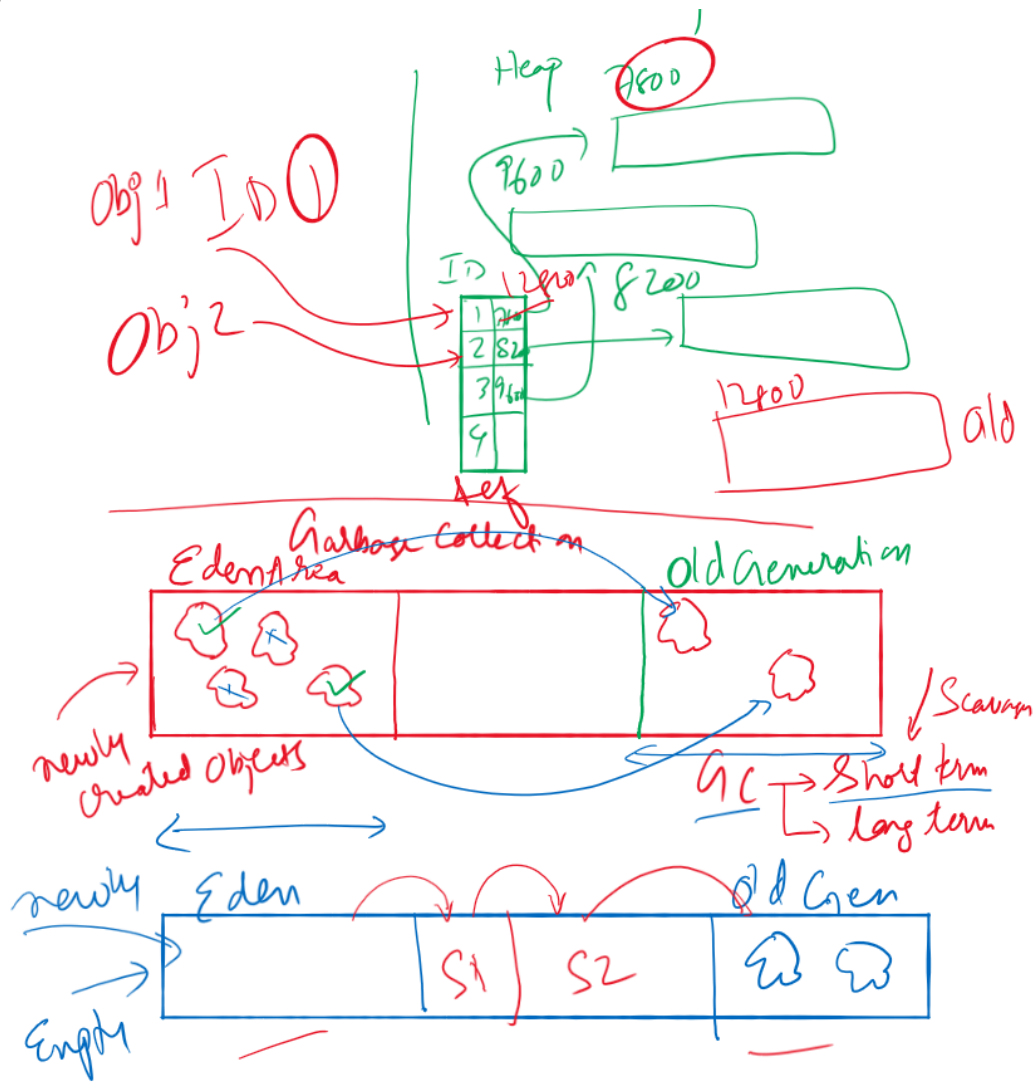

Array of Pointers:

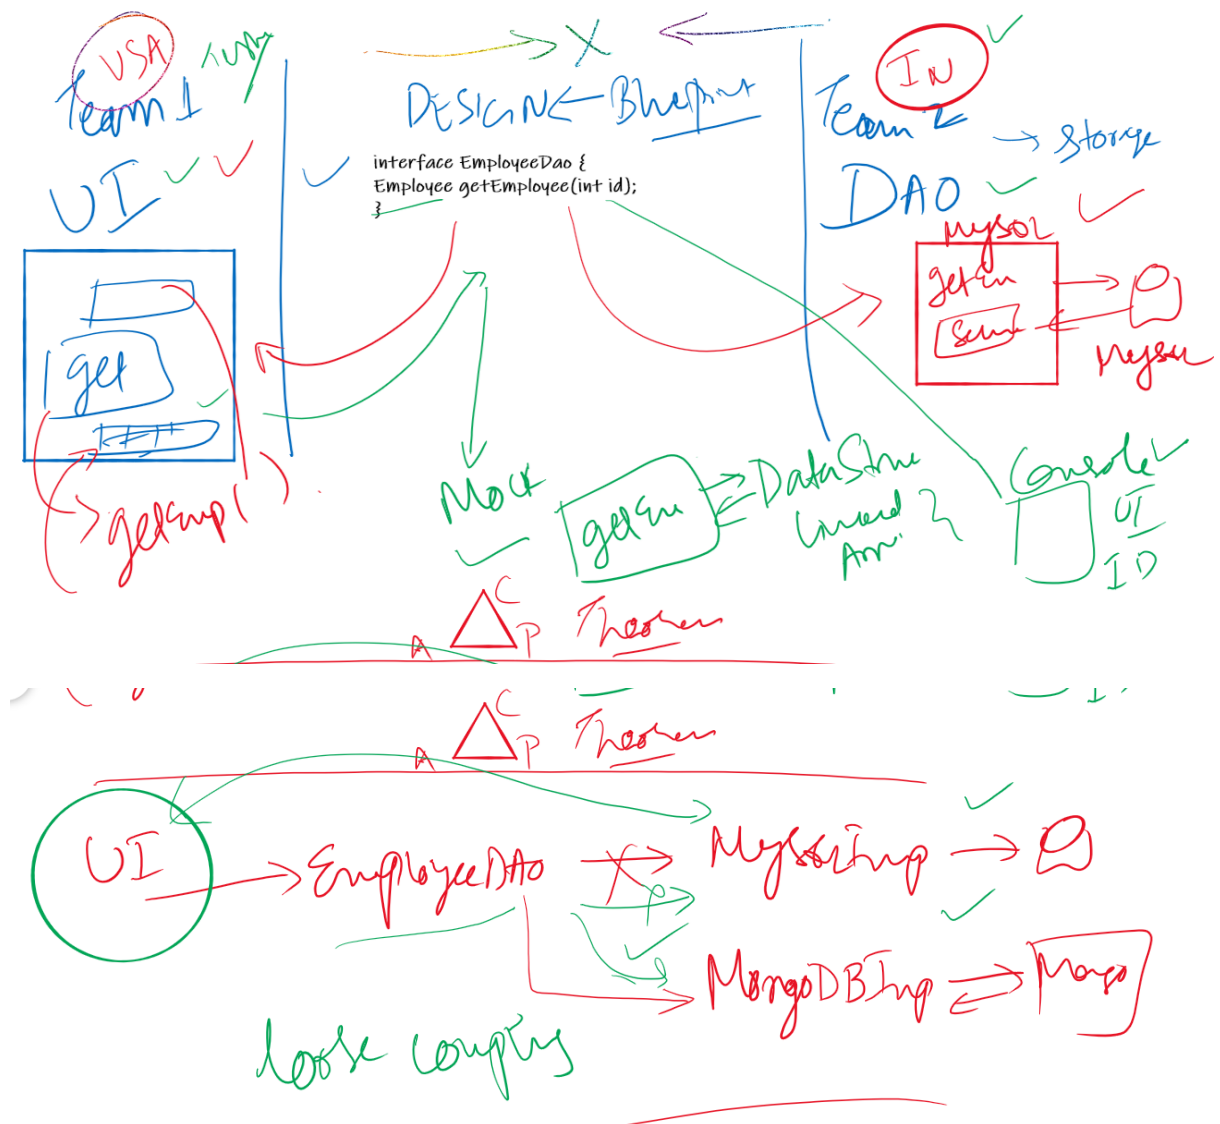

```
Product[] products = new Product[5]; // Array of 5 Pointers
products[0] = new Tv(133, "Sony Bravia", 135000.00, "LED"); // upcasting
products[1] = new Mobile(453, "MotoG", 12999.00, "4G");
products[2] = new Tv(634, "Onida Thunder", 3500.00, "CRT");
products[3] = new Mobile(621, "iPhone XR", 99999.00, "4G");
products[4] = new Mobile(844, "Oppo", 9999.00, "4G");
```

Programming to interface:

## Exception Handling:

### Default Handler

```
public class Test {
```

```
    public static void main(String[] args) {  
        System.out.println("Hello !!");  
        doTask();  
        System.out.println("Bye!!!");  
    }
```

```
    private static void doTask() {  
        int x = 10;  
        int y = 0;  
        System.out.println("Result : " + x / y);  
        System.out.println();  
    }
```

```
}
```

Hello !!

Exception in thread "main" java.lang.ArithmeticException: / by zero  
at Test.doTask(Test.java:13)  
at Test.main(Test.java:6)

Stack

doTask()  
Exception  
main()

1/zero  
JRE default handler

Checked

unchecked

1) compiler enforces programmer to handle them using try - catch syntax

2) these exceptions are a result of issues outside of JRE like [database, OS, filesystem, memory]  
like "UniqueKeyConstraint", "Connection issues", "FileNotFoundException"

1) Compiler doesn't enforce you to handle

2) Generally these exceptions happen due to reasons within JRE

Examples:

/ 0

Index based problems

int[] elem = {5,6,3};

int data = elem[8]; //

ArrayIndexOutOfBoundsException

Product p;

p.getId(); // NullPointerException

```
public class Test {
```

```
    public static void main(String[] args) {  
        System.out.println("Hello !!");  
        try {  
            doTask();  
        } catch (FileNotFoundException e) {  
            e.printStackTrace();  
        }  
        System.out.println("Bye!!!");  
    }
```

```
    private static void doTask() throws FileNotFoundException {  
        doAnotherTask();  
    }
```

```
    private static void doAnotherTask() throws FileNotFoundException {  
        FileInputStream fis = new FileInputStream("a.txt");  
    }  
}
```

Exception

doAnotherTask()  
doTask()  
main()

UI	Interface	DAO Implementation class
